IN3050/IN4050 Group sessions week 01

The goal for this week is that

1. You get a working environment with the tools we will use in the course.
2. You get familiar with the tools we will use in the course.

To get a working evironment on your own machine, the easisest way is to use Anaconda and follow the recipe in `anaconda-setup`.

If you prefer, you may alternatively build the environment yourself. You find a list of the packages we will use in `in3050_2023_env.yml`.

To get familiar with the tools, you have to find out how to run a jupyter notebook. You can then open the `test-notebook.ipynb` and work your way through it.
